

# Speed control

---

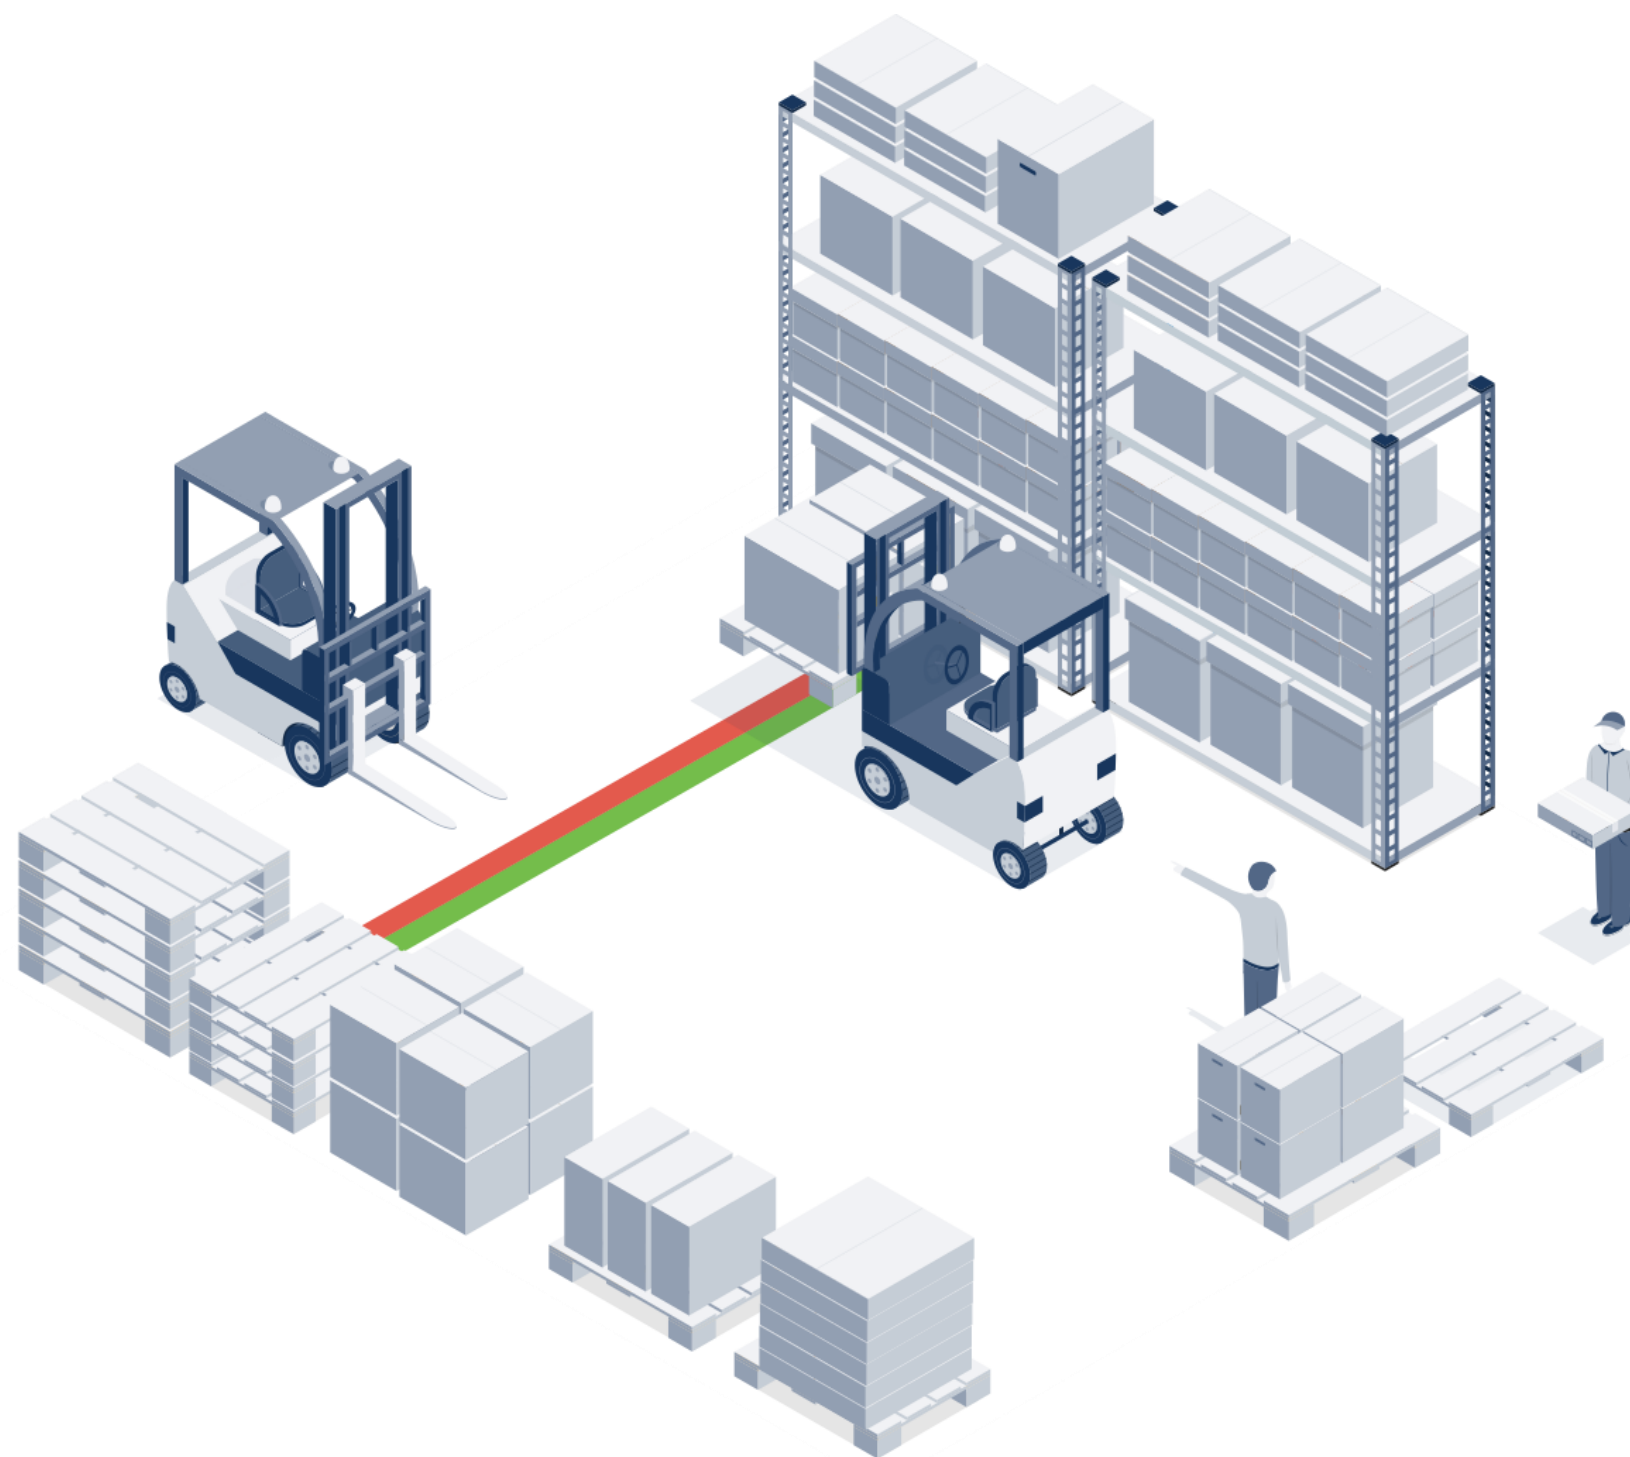

Color sensor for risk prevention

We have developed the SPEED CONTROL solution to easily and efficiently reduce the forklifts' speed in potential dangerous environments.

Based on a unique and innovative technology of color detection (adhesive strips, industrial paintings...), SPEED CONTROL allows to switch the slow and standard speed of the forklift.

The Speed Control can be easily adapted to any indoor environment that requires a precise safety area.

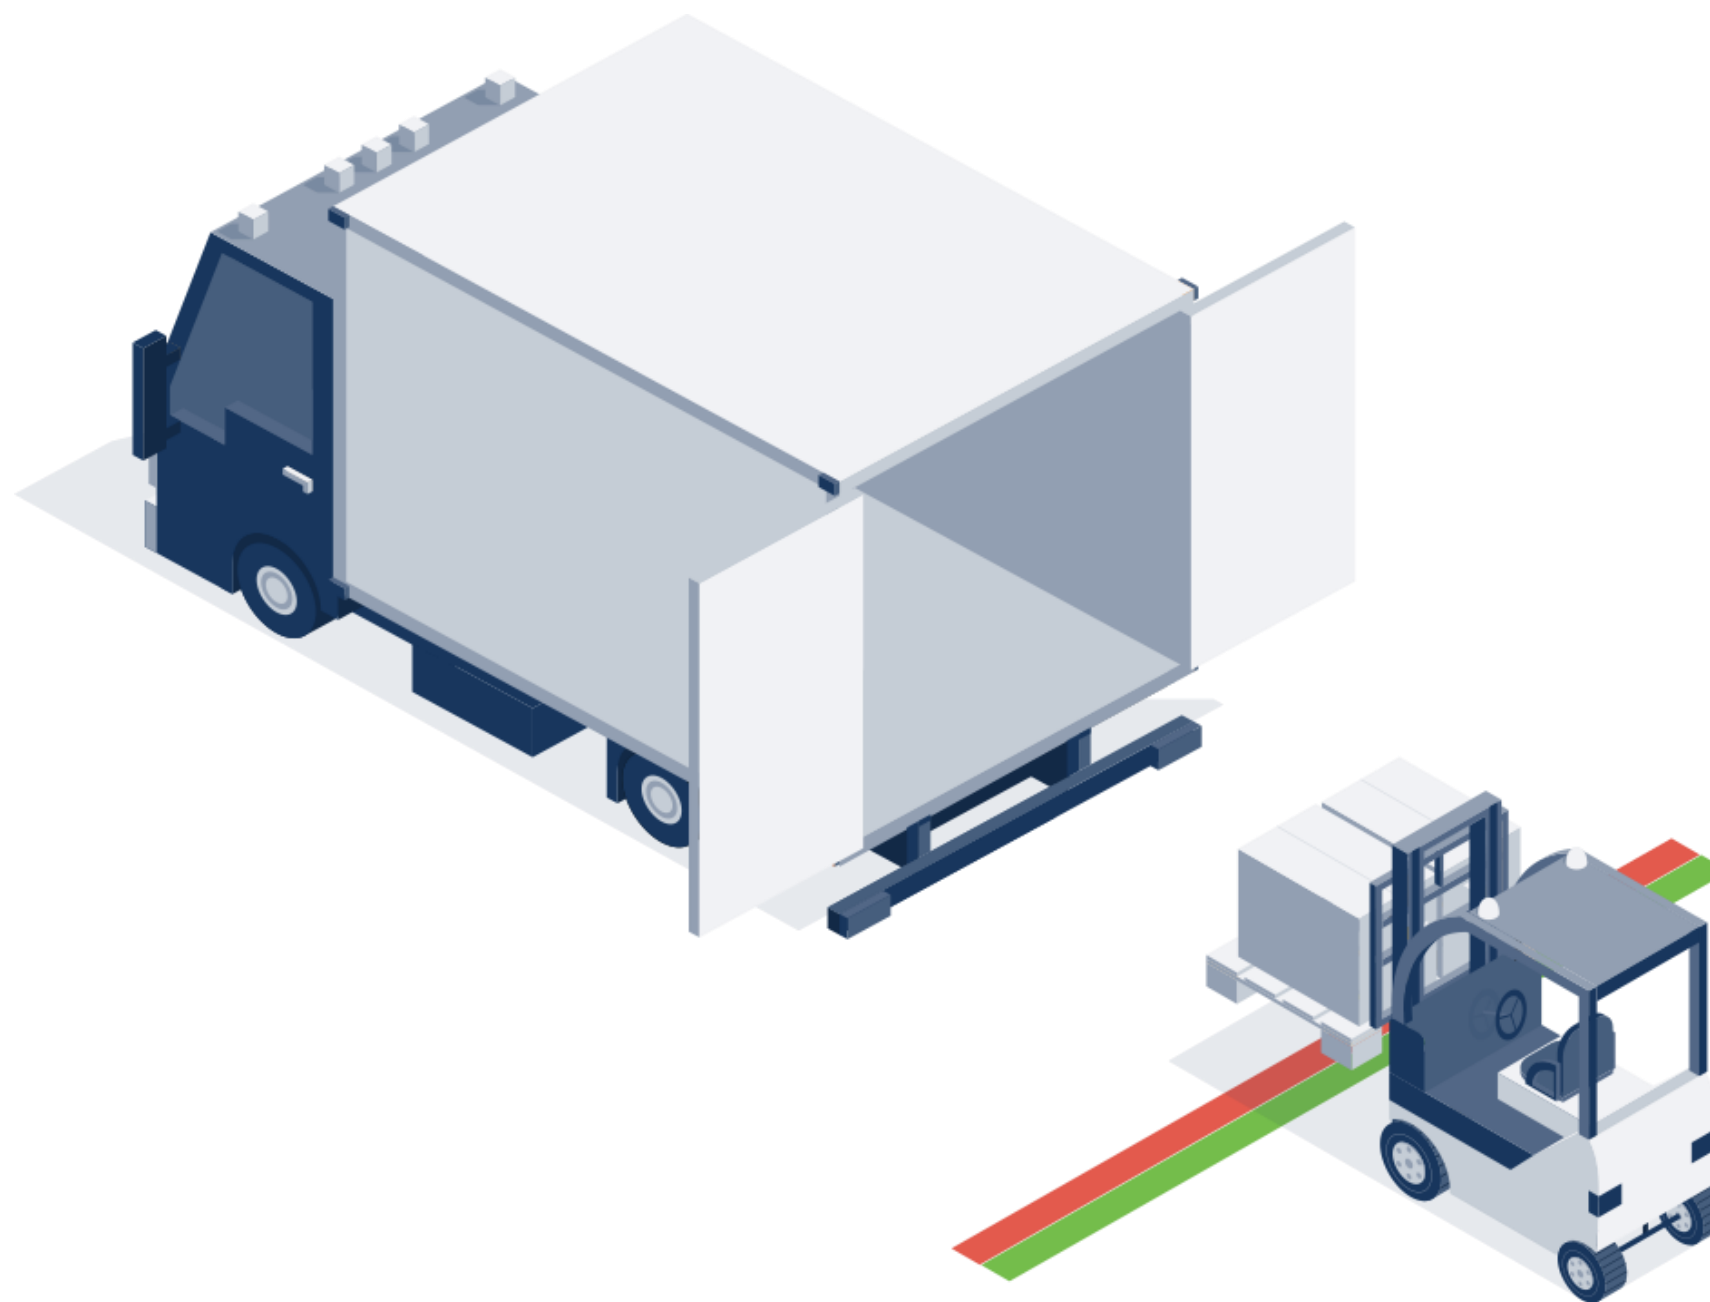

Adjustable to any brands or types of forklift, our solution is also able to trigger an action as :

- automatic slow-down (in case of an embedded function of speed limitation)
- audible or visual alarm
- Door opening ...

Forklift-specific information (as fork height) can be considered too, to set up relevant safety measures adapted to the client's needs.

### GOOD TO KNOW...

The SPEED CONTROL solution does not substitute to pedestrian and operators' attention. It has to be considered as a complementary safety tool.

# Features & Advantages

Immediate changing state

Detection up to 4 colors

Suitable to any handling  
material

No physical trauma for the  
operator

Can be adapted to an existing  
color-code as floor markings

No interference risk

Device mounted into the vehicle :  
no possible damage!

3 relays available

### Protecting sensitive areas

The proximity between pedestrian and forklifts leads to a potential risk of accident

### Protecting loading docks

Speed and haste lead to dangerous environment for people and goods

### Protecting crossings

Crossing, narrow aisle exit, blind corners are very common in warehouses and logistics sites.

### SAFETY AND PRODUCTIVITY ...

Accidents, even minors, have serious consequences and could seriously disturb the general activity of a company (production downtime, repairing costs ...). Securing environment allows to maintain, or even improve, the productivity by reducing those risks.
